- RF device can also be used as a member log-on, with user input from the till

Hardware Options

RF reader for VersaTerm

Key fob transponder device

General Description

The RF clerk option allows users to wear a wristband or a key fob attached to a key ring, and is identified by the system via non-contact read. The read transceiver is available on all Quest tills.

The RF clerk option provides an inexpensive method of identifying a clerk or other user of the system, reliably, quickly and securely. Simply pass the wristband or key fob over the build-in transceiver and you are logged on to the system immediately. If you leave the Quest till before the sale is finalized for any reason, the sale is automatically put on hold when another clerk logs on to the same till. At that time, another user can use the system with a new transaction and when the original clerk returns, their held sale is automatically recalled upon re-logging on to that till.

No fiddling about in the pocket for cards and inserting them or swiping them, simply pass your wrist over the transceiver and you are ready to use the system.
