- Till sleep mode activated from software
- Filters for ease of viewing most data lists in software dialogues

General Description

The Task Connect software solution has been specifically designed to maximize the use of the features of the V-touch, VersaTerm VM series, VL series, VMR series, Task Touch and Task Walkabout point of sale products.

It is Windows '98™, NT™, 2000™, ME™, XP™ compatible and provides an easy to learn and use interface for all back office functions, including the automatic management of locations and VersaTerms, together with various third party software interface options.

Make a price change, add a PLU, change a happy hour time, move a till to a new location in your facility, or enter a display message promoting an event of special, and Task Connect will do the rest, automatically updating the tills as required.

There is no need for users to download files to tills, no need to remember which till is in which bar, no need to program tills on site. Simply assign a till to a location and a keypad and Task Connect will update as required.

Tills can also be managed over a modem. This feature is ideal for the small trader who can use a home computer for management, or for the distributed franchise operation.
